

Content Management System (CMS) is a web application or a set of applications that allows you to easily create a Web site and its subsequent update and expansion of the editorial (non-technical) staff. Shaping the content and presentation on the site managed by the CMS is done through simple-to-use user interface, usually in the form of Web pages that contain advanced word processing, forms and modules.

The main task of each CMS is to separate content (site information content) from presentation (the way of its presentation). After the introduction of new information by the authorized editor, the system moves it to the database, while fulfilling its respective places on the web. The use of templates makes the change of graphical concept comes down to preparation and conversion of the template. Through this approach the process of publication on the Internet becomes very simple. Each [website](#) is generated dynamically, based on templates and content databases - a dynamic means in this case that on the site there are always up to date informations.

In recent years, CMS platform has evolved considerably, adding such possibility of flexible and dynamic modification of not only the content but also structure.

Content Management Systems performed in our projects are based on the databases MySQL and scripting language [PHP](#) . While building pages that contain the [CMS](#) system we use Joomla! 1.5 or 1.6 based on the GNU/GPL license, together with additional plugins and modules.

**CMS is the best solution used for individual projects and small and medium-sized enterprises.**

Writing sites built on a CMS system is so simple that anyone after a brief training session will be able to make changes himself.

Each project is evaluated individually. Please send us the completed [form](#) to analyze your project.
